Data Preparation

```
df_mtcars <- mtcars

# X-variables to use on RHS
ls_st_xs <- c('mpg', 'qsec')
ls_st_xs <- c('mpg')
ls_st_xs <- c('qsec')
ls_st_xs <- c('wt')
ls_st_xs <- c('mpg', 'wt', 'vs')

svr_binary <- 'hpLowHigh'
svr_binary_lb0 <- 'LowHP'
svr_binary_lb1 <- 'HighHP'
svr_outcome <- 'am'
sdt_name <- 'mtcars'

# Discretize hp
df_mtcars <- df_mtcars %>%
  mutate(!sym(svr_binary) := cut(hp,
                                breaks=c(-Inf, 210, Inf),
                                labels=c(svr_binary_lb0, svr_binary_lb1)))
```

Logit Regression and Prediction logit regression with glm, and predict using estimation data. Prediction and estimation with one variable.

Prediction with Binary set to 0 and 1 Now generate two predictions. One set where binary input is equal to 0, and another where the binary inputs are equal to 1. Ignore whether in data binary input is equal to 0 or 1. Use the same regression results as what was just derived.

Note that given the example here, the probability changes a lot when we

```

```

Prediction with Binary set to 0 and 1 Difference What is the difference in probability between binary = 0 vs binary = 1. How does that relate to the probability of outcome of interest when binary = 0 for all.

In the binary logit case, the relationship will be hump-shaped by construction between A_i and α_i . In the exponential wage cases, the relationship is convex upwards.

```
# Generate Gap Variable
df_mtcars <- df_mtcars %>% mutate(alpha_i = p_mpg_hp_bi1 - p_mpg_hp_bi0) %>%
  mutate(A_i = p_mpg_hp_bi0)

# Binary Marginal Effects and Prediction without Binary
scatter <- ggplot(df_mtcars, aes(x=A_i)) +
  geom_point(aes(y=alpha_i), size=4, shape=4, color="red") +
  geom_abline(intercept = 0, slope = 1) + # 45 degree line
  labs(title = paste0('Binary Marginal Effects and Prediction without Binary'),
       x = 'P(binary=0) for all',
       y = 'P(binary=1) - P(binary=0) gap',
       caption = paste0(sdt_name)) +
  theme_bw()
print(scatter)
```

Binary Marginal Effects and Prediction without Binary

X variables and A and alpha Given the x-variables included in the logit regression, how do they relate to A_i and α_i

```
# Generate Gap Variable
df_mtcars <- df_mtcars %>% mutate(alpha_i = p_mpg_hp_bi1 - p_mpg_hp_bi0) %>%
  mutate(A_i = p_mpg_hp_bi0)

# Binary Marginal Effects and Prediction without Binary
ggplot.A.alpha.x <- function(svr_x, df,
                             svr_alpha = 'alpha_i', svr_A = "A_i"){

  scatter <- ggplot(df, aes(x=!!sym(svr_x))) +
    geom_point(aes(y=alpha_i), size=4, shape=4, color="red") +
    geom_point(aes(y=A_i), size=2, shape=8, color="blue") +
    geom_abline(intercept = 0, slope = 1) + # 45 degree line
    labs(title = paste0('A (blue) and alpha (red) vs x variables=', svr_x),
          x = svr_x,
          y = 'Probabilities',
          caption = paste0(sdt_name)) +
    theme_bw()

  return(scatter)
}

# Plot over multiple
lapply(ls_st_xs,
       ggplot.A.alpha.x,
       df = df_mtcars)
